#### 前言

#### 概述

本文主要介绍UVC应用流程和功能,供客户参考开发。

### 产品版本

芯片名称	内核版本
RV1109	Linux 4.19
RV1126	Linux 4.19

#### 读者对象

本文档(本指南)主要适用于以下工程师:

技术支持工程师

软件开发工程师

#### 修订记录

版本号	作者	修改日期	修改说明
V1.0.0	НЈС	2020-04-15	初始版本
V1.1.0	НЈС	2020-06-23	更新格式
V1.2.0	HJC/LQH	2020-07-13	添加扩展功能和h265支持章节
V1.3.0	НЈС	2020-10-01	添加UVC PTZ/H265等接口说明
V1.4.0	НЈС	2020-11-04	FAQ添加MAC OS低版本兼容性处理
V1.5.0	HJC/LXH	2020-12-30	1.添加OSD功能说明 2.修改部分描述 3.FAQ添加RK工具识别支持方法 4.添加新的调试方法
V1.6.0	НЈС	2021-3-01	更新MAC OS低版本兼容性处理章节
V1.7.0	НЈС	2021-4-06	1.FAQ添加AUTO SUSPEND功能使能方法 2.FAQ添加NV12等新预览格式支持方法 3.FAQ添加帧率修改方法 4.FAQ添加默认格式修改方法
V1.8.0	НЈС	2021-7-15	1.FAQ添加NV12等新预览格式支持方法更新
V1.9.0	НЈС	2021-9-28	1.更新格式修改方法等以匹配新版本
V2.0.0	НЈС	2022-7-15	调整排版和内容

#### Rockchip UVCApp介绍

- 1. 简介
- 2. 使用方法
- 3. 源码结构及配置说明
  - 3.1 aicamera.sh
  - 3.2 USB脚本配置usb config.sh
  - 3.3 UVC功能配置文件uvc\_mpi\_cfg.conf
- 4. 流程框图
- 5. 扩展功能
  - 5.1 RV1126/RV1109 UVC XU扩展协议
  - 5.2 AUTO EPTZ功能介绍
  - 5.3 AUTO EPTZ功能验证
  - 5.4 UVC PTZ/EPTZ接口说明
  - 5.5 UVC OSD接口说明
- 6. 调试方法介绍
  - 6.1 原始数据流录制命令
  - 6.2 编码后数据流录制命令
  - 6.3 Full/Limit range调试
  - 6.4 UVC帧率打印
  - 6.5 UVC进程通信状态查看
  - 6.6 UVC日志打印等级调整
  - 6.7 UVC数据流耗时打印
- 7. FAQ
  - 7.1 如何修改UVC支持分辨率
  - 7.2 如何修改 PC 端 Amcap 工具显示的名字
  - 7.3 如何修改 PU指令支持描述符
  - 7.4 如何修改 device序列号
  - 7.5 如何关闭H264支持
  - 7.6 如何修改 XU支持最大16个指令
  - 7.7 如何修改 CT指令描述符
  - 7.8 如何添加H265编码格式支持
  - 7.9 苹果电脑低OS版本UVC无法预览兼容性处理方法
  - 7.10 如何支持RKDevTool识别UVC点击切换到loader
  - 7.11 使能AUTO SUSPEND功能方法
  - 7.12 如何添加NV12/I420预览格式支持
  - 7.13 如何修改或添加帧率
  - 7.14 如何修改UVC默认格式
  - 7.15 如何优化UVC预览延时

## 1. 简介

uvc\_app实现了完整的UVC device的功能,包括配置、预览、切换、事件及指令响应等,通过采集摄像头的数据,经YUV2转换或MJPG编码或者H264编码后通过USB UVC 的ISOC模式传输到主机端预览。

# 2. 使用方法

- 使能uvc\_app: make menuconfig, 选择enable uvc\_app或在buildroot对应产品defconfig中添加 BR2\_PACKAGE\_UVC\_APP=y
- 确认usb\_config.sh: 确认usb设备配置,目前支持uvc和uac、adb复合,usb复合设备配置修改:
  device/rockchip/oem/oem\_uvcc/usb\_config.sh
- 执行uvc\_app默认将摄像头数据通过uvc传输 若sensor等uvc camera相关模块还未ready,可使用测试模式测试uvc 通路,方法如下:

```
[root@RV1126_RV1109:/]# usb_config.sh
[root@RV1126_RV1109:/]# uvc_app 1280 720
```

从sensor取流编码到uvc预留输出方案启动在开机脚本中配置:

device/rockchip/oem/oem\_uvcc/aicamera.sh

注意: 该流程需要确保sensor配置和从isp出流功能正常,否则会因为sensor配置失败无法正常启动 uvc app。

host端使用uvc camera 软件(linux上guvcview、window上amcap、potplayer等)选择对应mjpeg 1280x720数据流格式即可预览,正常连接情况下host端识别到uvc设备能够预览看到测试彩条界面。

# 3. 源码结构及配置说明

```
huangjc@S1-GITSER-144:~/rv1126 rel/external/uvc app$ tree -L 2
                       (封装用于解析mpp enc cfg.conf编码配置文件接口)
 - cJSON
- CMakeLists.txt
 — doc
                     (文档目录)
  L_ zh-cn
 — libs
                      (非开源库存放目录)
── main.c (程度八日四級/

── mpp_enc_cfg.conf (uvc编码功能等配置文件,运行时会生成在data目录下)

── process (camera处理,包括pu\fps等控制调用)
 - main.c
                       (程序入口函数)
- readme.md
                       (uvc功能实现)
uvc config.sh (仅供参考,实际使用
device/rockchip/oem/oem_uvcc/usb_config.sh)
```

uvc目录下重点文件说明如下:

- 热拔插事件: uevent.c, uevent.h
- uvc: uvc处理代码
  - o 控制uvc, camera, 编码线程的打开关闭: uvc control.c, uvc control.h
  - uvc编码传输处理: uvc encode.cpp, uvc encode.h
  - uvc主流程: uvc-gadget.c, uvc-gadget.h
  - uvc多节点操作, buffer管理: uvc\_video.cpp, uvc\_video.h
  - MJPG/H264/h265编码: mpi enc.c, mpi enc.h
  - YUV格式转化: yuv.c, yuv.h
  - uvc配置描述符解析: uvc configfs.c, uvc configfs.h
- drm内存操作: drm.c, drm.h

#### 3.1 aicamera.sh

默认情况,RV1126固件中会从device/rockchip/oem/oem\_uvcc/aicamera.sh拷贝到机器/oem/下,开机脚本RkLunch.sh中会启动运行该脚本,需要关注脚本中如下实现:

```
check alive() #判断uvc app进程是否异常退出,若退出做reprobe uvc配置重启uvc app处理以自动
恢复uvc功能
           #其中还有检测sensor相关ispserver进程异常重启处理,取流和ai等处理进程
aiserver异常重启处理都在这里实现
}
usb irq set() #这里主要将usb中断处理放到cpu1上,优化uvc传输稳定性,需要启动带上
 #for usb uvc iso
 usbirq=`cat /proc/interrupts |grep dwc3| awk '{print $1}'|tr -cd "[0-9]"`
 echo "usb irq:$usbirq"
 echo 1 > /proc/irq/$usbirq/smp affinity list
#ulimit -c unlimited
dbserver & #启动数据库进程,uvc应用中pu指令数据会通过数据库接口保存到data下db文件
中
ispserver -n & #isp aiq的应用启动,该进程负责aiq的初始化、运行、注销、效果动态处理
等,-n参数表示启动不同步数据库保存参数,使用默认iq文件配置
stop unused daemon
                 #uac 应用启动,若配置了uac1或者uac2复合设备,需要确保该应用启动
#uac app &
/oem/usb_config.sh rndis #置usb 复合设备, usb config默认打开uvc和adb, 后跟第一个参数
rndis表示配置为uvc+rndis+adb, 其它配置如uac1替换rndis参数即可, 若后跟第二个参数off则表示关
闭adb,配置为uvc+rndis,rndis参数改为uac1 rndis代表配置为uvc+uac1+rndis+adb
usb irq set
          #uvc应用启动,配合usb config完成uvc完整功能
uvc app &
aiserver & #该应用主要负责vi/nn/vo等处理,默认uvc app不负责取流,是该进程跨进程传递buf给
uvc app完成
sleep .5
smart display service &
while true
 check alive dbserver
 check alive ispserver
 check alive uvc app
# check alive uac app
 check alive aiserver
# check uvc buffer
```

```
# check_uvc_suspend
sleep 2
check_alive smart_display_service
done
```

# 3.2 USB脚本配置usb\_config.sh

关注如下配置及说明:

```
#!/bin/sh
                                     #ADB 配置使能
ADB EN=on
DFU EN=off
if ( echo $2 |grep -q "off" ); then
ADB EN=off
fi
. . .
##main

# 4. 流程框图

# 5. 扩展功能

# 5.1 RV1126/RV1109 UVC XU扩展协议

rv1126/1109 camera实现了UVC标准扩展单元请求控制,可进行host端与camera端的自定义XU命令控制。目前已预置的控制请求包括以下类型,其中CMD\_TOOLS\_CTRL\_1、CMD\_GET\_CAMERA\_VERSION、CMD\_SET\_CAMERA\_IP、CMD\_SET\_EPTZ有进行相关处理,其余指令预留,客户可根据需求进行开发。

```
enum XuCmd {

CMD_TOOLS_CTRL_1 = 0x01, //RK工具通信指令,如loader切换功能

CMD_GET_CAMERA_VERSION, //获取摄像头版本

CMD_SET_CAMERA_IP, //获取网络IP

//CMD_START_CAMERA, //启动摄像头

CMD_SHUTDOWN_CAMERA, //关闭摄像头

CMD_RESET_CAMERA, //重启摄像头

CMD_SET_MOTOR_RATE = 0x06, //摄像头舵机/电机控制预留接口
```

```
CMD_SET_MOTOR_BY_STEPS = 0x07, //摄像头舵机/电机控制预留接口
CMD_SET_MOTOR_BY_USER = 0x08, //摄像头舵机/电机控制预留接口
CMD_STOP_MOTOR_BY_USER = 0x09, //摄像头舵机/电机控制预留接口
CMD_SET_EPTZ = 0x0a, //EPTZ功能使能控制
CMD_SET_H265 = 0x0b, //H265切换
CMD_MAX_NUM = CMD_SET_H265,
};
```

为实现上述控制,rv1126/1109 camera Device端,需在kernel配置UVC XU相关描述符,在uvc\_app中对host端发送的XU指令进行解析处理。Host端可以参考Device端kernel描述符配置以及具体指令定义,在CameraHal层封装相应接口,提供上层应用进行自定义协议的相关功能调用。

- kernel相关文件: drivers/usb/gadget/function/f\_uvc.c、drivers/usb/gadget/function/u\_uvc.h。
- uvc\_app相关文件: uvc-gadget.c、uvc-gadget.h。

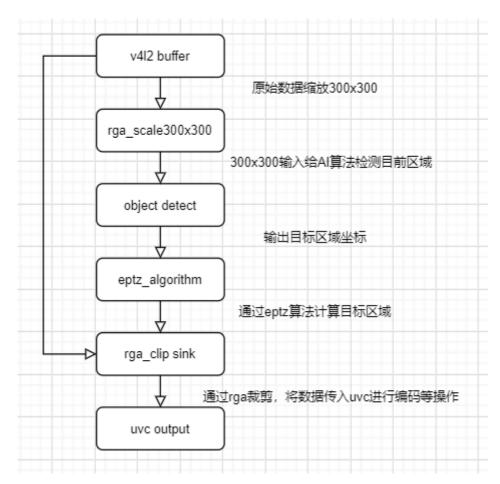

在f\_uvc.c文件的uvc\_alloc\_inst函数下,可以对UVC设备的描述符进行配置,如bUnitID、guidExtensionCode、bmControls等,这些信息将作为UVC设备EU控制单元的标识,host端的XU请求将通过标识信息与UVC设备进行匹配,从而进行扩展协议控制。UVC设备描述符可以通过usbtreeview工具进行获取,以下为截取的部分XU描述符信息。

```
----- Video Control Extension Unit Descriptor ----
bLenath
                     : 0x1A (26 bytes)
bDescriptorType
                     : 0x24 (Video Control Interface)
bDescriptorSubtype
                     : 0x06 (Extension Unit)
                     : 0x06
bUnitID
                     : {41769EA2-04DE-E347-8B2B-F4341AFF003B}
guidExtensionCode
bNumControls
                     : 0x03
bNrInPins
                     : 0x01 (1 pins)
baSourceID[1]
                     : 0x02
bControlSize
                      : 0x01
bmControls
                      : 0x07
D0
                      : 1 yes - Vendor-Specific (Optional)
                      : 1 yes - Vendor-Specific (Optional)
D2
                      : 1 yes - Vendor-Specific (Optional)
                      : 0 no - Vendor-Specific (Optional)
D3
D4
                      : 0 no - Vendor-Specific (Optional)
                      : 0 no - Vendor-Specific (Optional)
D5
                      : 0 no - Vendor-Specific (Optional)
D6
                     : 0 no - Vendor-Specific (Optional)
D7
 . . .
```

其中bUnitID、guidExtensionCode等信息即为kernel中配置信息,host端通过指定bUnitID以及对应的XuCmd命令即可实现对camera device端的控制。如对EPTZ进行开关,host端需要bUnitID为0x06的XU单元发送对应的EPTZ控制指令0x0a以及数据1或0,uvc\_app记录当前状态后,在下次打开预览时则使能或关闭EPTZ功能。(若使用SDK中默认的指令控制,需参考7.6节修改kernel相关文件)。

## 5.2 AUTO EPTZ功能介绍

AUTO EPTZ是指通过软件手段,结合智能识别技术实现预览界面的"数字平移-倾斜-缩放/变焦"功能。 RV1126/RV1109 UVC Camera方案,该功能默认已支持,其实现流程框图大致如下:

其最终的显示效果, 遵循以下策略:

- 单人:在camera可视范围内,尽可能将人脸保持在画面中间。
- 多人:在camera可视范围内,尽可能的显示人多画面,且将其保持在画面中间。

### 5.3 AUTO EPTZ功能验证

RV1126/RV1109使用AUTO EPTZ功能,需将dts中的otp节点使能,evb默认配置中已将其使能:

```
&otp {
    status = "okay";
};
```

在RV1126/RV1109中,提供三种方案进行AUTO EPTZ功能验证及使用。

- 环境变量:在启动脚本(例如: RkLunch.sh)中添加环境变量export ENABLE\_EPTZ=1,默认开启EPTZ功能,在所有预览条件下都将启用人脸跟随效果。
- XU控制:通过UVC扩展协议,参考5.1中描述进行实现。当uvc\_app接收到XU的 CMD\_SET\_EPTZ(0x0a)指令时,将根据指令中所带的int参数1或0,进行EPTZ功能的开关,以确认 下次预览时是否开启人脸跟随效果。
- dbus指令: 最新版本已支持通过dbus指令通知aiserver进程跨进程动态启动 AUTO EPTZ能力:

```
#开启命令
dbus-send --system --print-reply --type=method_call --
dest=rockchip.aiserver.control /rockchip/aiserver/control/graph
rockchip.aiserver.control.graph.EnableEPTZ int32:1

#关闭命令
dbus-send --system --print-reply --type=method_call --
dest=rockchip.aiserver.control /rockchip/aiserver/control/graph
rockchip.aiserver.control.graph.EnableEPTZ int32:0
```

通过RV1126/RV1109套件串口的输出日志进行判断EPTZ功能是否生效,若EPTZ功能生效,串口输出如下:

```
uvc_camera :uvc width:xxx,height:xxx, needEPTZ 1, needRGA x \n
uvc_camera :needEPTZ uvc width: xxx,height:xxx.
```

若EPTZ功能未生效,串口输出如下:

```
uvc_camera :uvc width:xxx,height:xxx, needEPTZ 0, needRGA x \n
uvc_camera :needEPTZ, match fail
uvc_camera :needEPTZ, not support this width(>1920) and height(>1080).
```

# 5.4 UVC PTZ/EPTZ接口说明

RV1126/RV1109已实现USB UVC 协议中关于缩放、平移、倾斜(上下移)等云台PTZ功能,对应CT指令为: CT\_ZOOM\_ABSOLUTE\_CONTROL和CT\_PANTILT\_ABSOLUTE\_CONTROL。其中CT\_PANTILT\_ABSOLUTE\_CONTROL包含pan(左右平移)和tilt(一般为上下移)控制,参考章节7.7打开对应CT指令描述符即可:

```
rv1109/kernel$ git diff
diff --git a/drivers/usb/gadget/function/f uvc.c
b/drivers/usb/gadget/function/f uvc.c
index 4888af0..32f8ae4 100644
--- a/drivers/usb/gadget/function/f uvc.c
+++ b/drivers/usb/gadget/function/f uvc.c
@@ -1026,7 +1026,7 @@ static struct usb function instance *uvc alloc inst(void)
       cd->wOcularFocalLength = cpu_to_le16(0);
                                     = 3;
       cd->bControlSize
                                    = 2;
      cd->bmControls[0]
      cd->bmControls[1]
                                     = 0;
      cd->bmControls[1]
                                    = 0x2a;
       cd->bmControls[2]
                                    = 0;
       pd = &opts->uvc_processing;
```

PTZ接口定义在process/camera\_control.h中,客户对应云台控制操作可以在对应接口中实现:

```
void camera_control_set_zoom(int val);//zoom 缩放接口,默认1-5.0缩放void camera_control_set_pan(int val); //左右平移接口void camera_control_set_tilt(int val);//上下移接口
```

EPTZ是在上述PTZ接口中通过软件来处理,达到类似电机控制画面位置的效果。 简单来讲如HOST端设置480p分辨率,开启EPTZ功能时,程序会先读取720p或1080p等sensor支持的大分 辨率画面crop或scale成需要的480p画面。该功能具体是通过外部aiserver进程调用rockit库处理实现的, uvc app仅处理调用流程。

其中对应CT指令默认值定义在uvc/uvc-gadget.c中,如zoom:

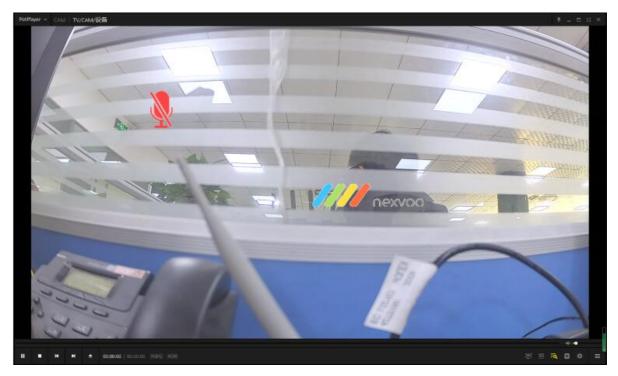

```
//ZOOM
#define CT ZOOM ABSOLUTE CONTROL MIN VAL
                                                10
#define CT ZOOM ABSOLUTE CONTROL MAX VAL
#define CT ZOOM ABSOLUTE CONTROL STEP SIZE
                                                1
#define CT_ZOOM_ABSOLUTE_CONTROL_DEFAULT_VAL
                                                10
//PANTILT
#define CT PANTILT ABSOLUTE CONTROL MIN VAL
                                                   -36000
#define CT PANTILT ABSOLUTE CONTROL MAX VAL
                                                   36000
#define CT_PANTILT_ABSOLUTE_CONTROL_STEP_SIZE
                                                    3600
#define CT PANTILT ABSOLUTE CONTROL DEFAULT VAL
```

windows pc上amcap软件中的调试窗口显示如图

# 5.5 UVC OSD接口说明

V1.28版本以上已实现预览OSD功能,目前支持水印功能,暂只支持32bit ARGB bmp图片水印:

目前支持MJPEG/H264/H265格式下的水印功能,其中MJPEG使用RGA接口处理叠加,其它两种格式直接调用编码库接口实现,另外YUV格式默认不支持,客户有需要自行参考MJPEG中实现移植添加支持。

1. 打开OSD方法: 需要将代码跟conf使能都打开。

```
代码使能: uvc/mpp_osd.h中使能MPP_ENC_OSD_ENABLE
#define MPP_ENC_OSD_ENABLE 1
conf使能:mpp_enc_cfg.conf中以下内容, enable的off改为on即可。
"osd": {
    "enable": "off",
    ...
}
```

#### 2. 水印conf说明:

```
"osd" : {
          "enable": "off", //水印使能
          "count": 2, //水印个数,最多支持8个
          "plt user": 1,//是否使用用户自定义画板,代码中可以增加画板定义
          "osd 0": { //水印1参数
             "type":"picture",//水印1类型
             "enable": "on",//水印1默认是否打开
             "1280*720": {//水印1 预览分辨率1280*720时参数
                 "path": "/data/osd 0.bmp",//水印1 1280*720时图片路径,长度不要超
过32字节,图片宽高需要16位对齐
                 "start x": 0.65,//水印1 1280*720时起始位置x(0-1),1280*x,会自
动16位对齐
                 "start y": 0.85//水印1 1280*720时起始位置y(0-1),720*y,会自动
16位对齐
             },
             "1920*1080": {//水印1 预览分辨率1920*1080时参数
                 "path" : "/data/osd 0.bmp",
                 "start x": 0.75,
                 "start y": 0.9
             "3840*2160": {//水印1 预览分辨率3840*2160时参数
                 "path" : "/data/osd 0.bmp",
```

```
"start x": 0.8,
       "start y": 0.8
   },
   //可以随意增加其他分辨率如"640*480" "320*240"
   "common": {//水印1预览分辨率其他分辨率时参数
       "path" : "/data/osd_0.bmp",
       "start x": 0.8,
       "start_y": 0.8
   }
},
"osd_1": {//水印2参数,具体同水印1。
   "type" : "picture",
   "enable" : "on",
   "1280*720": {
       "path" : "/data/osd 1.bmp",
       "start x": 0.0,
       "start_y": 0.0
   },
   "1920*1080": {
       "path" : "/data/osd 1.bmp",
       "start x": 0.0,
       "start_y": 0.0
   },
   "3840*2160": {
       "path" : "/data/osd 1.bmp",
       "start x": 0.0,
       "start_y": 0.0
   },
   "common": {
       "path" : "/data/osd 1.bmp",
       "start x": 0.0,
       "start_y": 0.0
   }
}
```

注意: osd图片目前仅支持32bit透明背景bmp图片,需要客户自行转换好bmp素材,配置好conf

3. mpp osd接口使能控制伪代码,具体使用代码见mpp\_osd.c

#### 4. mpp osd接口画板使用

```
1、plt_user为0时为默认画板,使用mpp_osd.c中u32DftARGB8888ColorTbl, 无需修改
2、plt_user为1时为用户自定义画板,使用mpp_osd.c中u32DftARGB8888ColorTblUser。
修改方式:
从argb图像中获取水印的各颜色分量数值,如透明色a:0x00 r:0xff g:0xff b:0xff
则可以将u32DftARGB8888ColorTblUser数组的一个数值修改为0x00ffffff; 其他颜色同这个方式进行修改即可。比如水印只有3个颜色,只需要修改前面三个数值。
```

# 6. 调试方法介绍

### 6.1 原始数据流录制命令

录制打开命令:

```
touch /tmp/uvc_enc_in
```

录制关闭命令:

```
rm /tmp/uvc_enc_in
```

录制的数据会保存在data/uvc\_enc\_in.bin,可pull出来用yuv数据查看软件如7yuv查看数据。

## 6.2 编码后数据流录制命令

录制打开命令:

```
touch /tmp/uvc_enc_out
```

录制关闭命令:

```
rm /tmp/uvc_enc_out
```

录制的数据会保存在data/uvc\_enc\_out.bin,可pull出来用对应解码软件查看数据。

### 6.3 Full/Limit range调试

下面debug方法可用来测试host端通路是full range还是limit range,对于isp效果调试比较重要:

前提:准备测试yuv数据到固件如:/oem/full\_range.yuv

- 1. 打开camera前device端串口输入echo /oem/full\_range.yuv > tmp/uvc\_range\_in
- 2. 打开camera 1080p分辨率可以看到host端显示特殊的灰阶图;
- 3. 观察0和1,如果颜色一致则是limit,颜色有区别则为full。

# 6.4 UVC帧率打印

打开查看命令:

```
touch /tmp/uvc_ipc_fps
```

关闭查看命令:

```
rm /tmp/uvc_ipc_fps
```

### 6.5 UVC进程通信状态查看

打开查看命令:

```
touch /tmp/uvc_ipc_state
```

如下log:

send state:4, recv state:4

如果两者一直都是状态4,说明aiserver没有送图给uvc。

关闭查看命令:

```
rm /tmp/uvc_ipc_state
```

### 6.6 UVC日志打印等级调整

应用启动前修改环境变量:

```
export uvc_app_log_level=x

x=0 mean err
x=1 mean warn
x=2 mean info
x=3 mean debug
recommended setting x=2
```

# 6.7 UVC数据流耗时打印

打开查看数据流耗时命令:

```
touch /tmp/uvc_use_time
```

关闭查看数据流耗时命令:

```
rm /tmp/uvc_use_time
```

# **7. FAQ**

# 7.1 如何修改UVC支持分辨率

应用补丁

```
external/uvc_app$ git diff .
diff --git a/uvc/uvc-gadget.c b/uvc/uvc-gadget.c
index 6f71a0c..3eecf12 100755
```

### 7.8 如何添加H265编码格式支持

由于UVC协议本身还不支持H265格式,若产品需要支持H265,SDK当前有两种方法修改方案:方案一:

- 方法: 直接强制修改H264编码配置为H265, H265码流通过H264通路传输给HOST端解码
- 好处: 改动小, host端只需将UVC H264通路传输过来的码流按照H265格式解码即可。
- 缺点:需要host端配合,预览前约定好走h264还是h265,适合定制类产品,如智慧屏。

具体修改补丁如下:

目前为了能同时支持H264和H265切换,外部程序可以通过执行如下命令来切换选择:

```
#切到H265编码
touch /tmp/use_encodec_h265

#关闭H265编码
rm /tmp/use_encodec_h265
```

#### 方案二:

- 方法:修改描述符framebased节点配置,把H264配置改为H265配置,H265码流通过framebased(原H264)通路传输给HOST端解码,要求HOST端UVC驱动和应用也要添加H265配置的支持
- 好处:通过修改描述符方式添加,相对会标准一些,通常一些PC端软件能支持显示。
- 缺点:对android端不太友好,需要android端驱动和camera框架添加支持H265通路,改动较大。适合主要接PC端的标准usb camera 产品。

该方案通过修改描述符方式添加,相对会标准一些。在PC端可以使用公开的第三方软件,如PotPlayer可以看到h265的格式并选择。

具体修改补丁如下:

```
case V4L2 PIX FMT H264:
       cmd->type = MPP VIDEO CodingAVC;
        cmd->type = MPP VIDEO CodingHEVC;
        break:
    default:
        LOG INFO("%s: not support fcc: %d\n", __func__, fcc);

```

#### 注意:

默认RV1126/RV1109/RK3568 SDK的USB Camera产品配置中,uvc脚本配置源码位置在下面目录中,要将上述补丁中uvc\_config.sh对应修改挪到usb\_config.sh才会生效。另外,从V1.4.0版本开始,不再需要修改uvc app中代码,仅修改脚本配置即可生效。

```
~/rv1109$ device/rockchip/oem/oem_uvcc/usb_config.sh
```

内核添加H265描述符支持补丁如下:

### 7.9 苹果电脑低OS版本UVC无法预览兼容性处理方法

我们在兼容性测试中发现,苹果电脑系统MAC OS 10.15版本及以上才支持UVC maxpacket配置为3K,以下的版本最大只支持配置到1K,若要强制支持3K微帧配置,probe阶段需要主动设置3k配置给pc,目前代码最新版本已默认支持。

### 7.10 如何支持RKDevTool识别UVC点击切换到loader

最新版本已默认适配RKDevTool XU扩展指令功能,支持RKDevTool识别到UVC设备,并支持点击工具上切换按钮自动切换到loader烧录模式,方便客户烧写。

RKDevTool 默认代码中预置的UVC设备pid为0x0016,vid为0x2207,若客户机器有修改默认的pid和vid,需要添加到RKDevTool 工具目录下的config.ini中,修改保存后重新打开工具:

```
[System]
#自定义Msc VID和PID,值十六进制,例:MSC_VID=0x0BB4,MSC_PID=0x0C01
MSC_VID=
MSC_PID=
ADB_VID=0x2207
ADB_PID=0x0046
MTP_VID=
MTP_PID=
UVC_VID=0x2207
UVC_PID=0x0020
```

# 7.11 使能AUTO SUSPEND功能方法

新版本驱动和应用已支持USB AUTO SUSPEND,即自动体眠唤醒功能,默认代码中是关闭的。在使用电池供电的host设备上如PC,能够识别到待机唤醒指令,做对应待机唤醒处理,达到优化功耗目的,开启方法如下:

kernel:

```

### 7.12 如何添加NV12/I420预览格式支持

新版本应用中默认已添加NV12/I420格式支持,需要在对应格式列表和usb配置脚本中添加配置支持。需要注意的是,常见的HOST端软件如AMCAP本身并不很好的支持这种非常用的YUV预览格式(常用为YUYV格式),故需要根据具体HOST需求选择是否开启,目前已测试POTPLAYER软件能够支持预览。

uvc\_app:

#### 注意:

默认RV1126/RV1109/RK3568 SDK的USB Camera产品配置中,从V1.4.0版本开始,不再需要修改uvc app 中代码,仅修改脚本配置即可生效。

### 7.13 如何修改或添加帧率

UVC帧率修改或添加主要通过修改描述符字段dwFrameInterval来控制。修改时需要同时修改usb\_config.sh 脚本和uvc\_app应用的uvc-gadget.c中格式列表,如下,添加mjpeg 60fps支持的修改(fps = 1000000 / FrameInterval):

```
usb config.sh:
huangjc@RD-DEP1-SERVER-163:~/RV1109 rel/device/rockchip/oem/oem uvcc$ git diff .

};
```

默认RV1126/RV1109/RK3568 SDK的USB Camera产品配置中,从V1.4.0版本开始,不再需要修改uvc app 中代码,仅修改脚本配置即可生效。

### 7.14 如何修改UVC默认格式

UVC默认格式一般分为默认编码格式、默认分辨率和默认帧率,其中默认帧率可以通过修改usb\_config.sh分辨率配置中的字段dwDefaultFrameInterval来控制。对于默认分辨率和编码格式,内核驱动默认会选择描述符种对应的第一个配置(有些host应用会按自身应用要求从支持的分辨率和格式列表中选择一个作为默认值),如下,修改默认编码格式和分辨率为mjpeg 1280x720:

```
huangjc@RD-DEP1-SERVER-163:~/RV1109 rel/external/uvc app$ git diff
